CASE STUDY

LEGAL / IMMIGRATION

AI Document Extraction & ERP Automation for Tax Statements

An AI document-processing pipeline for an immigration law office, using OCR and information extraction to reconcile tax obligations, populate the ERP and prepare tax statements and payment requests for 30+ international investors.

KEY METRIC

€120K+

booked in accounts receivable

200+

Records entered into the ERP automatically

30+

Investors with automated tax statements

Manos Fragkiadakis

LEGAL / IMMIGRATION

€120K+ in accounts receivable.

PROJECT
Tax Statement Automation

CLIENT
Immigration law office

INDUSTRY
Legal / Immigration

ROLE
AI Engineer

CONTEXT
An immigration law office supporting 30+ international investors with annual tax filings — years of unbilled work spread across fragmented data sources.

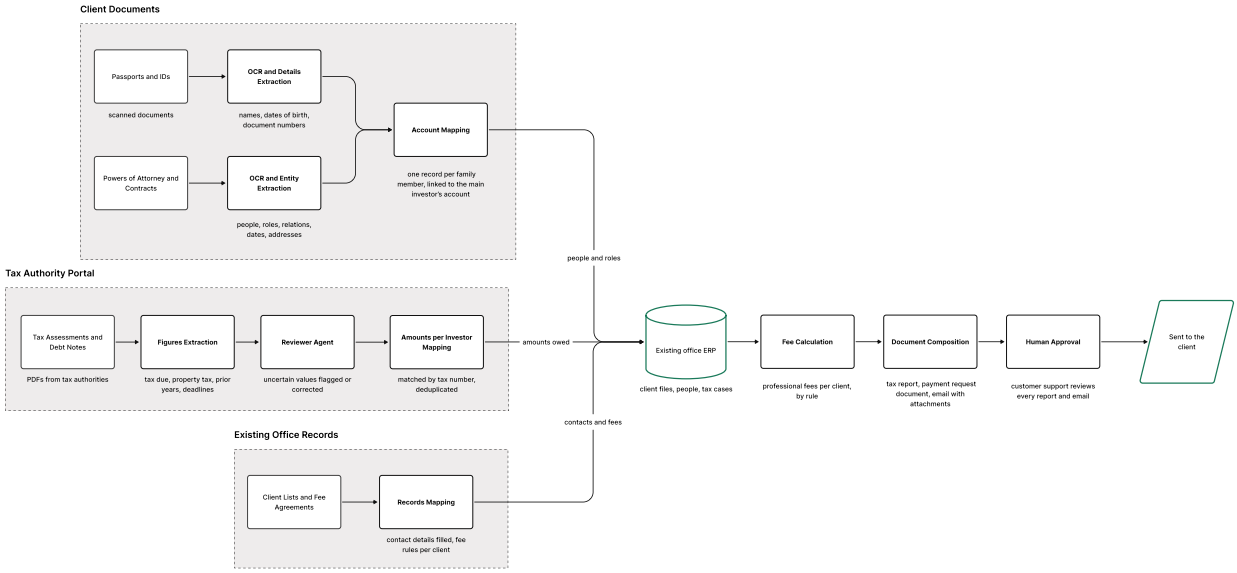

Challenge

For years, the office had handled the annual tax filings of its international clients free of charge — a courtesy that had quietly grown into a serious administrative burden. Determining what each client owed meant connecting data from multiple sources: powers of attorney, tax authority records, previously owed amounts, and the office's own client lists and fee agreements. When the office decided to start charging for the service, 30+ clients, some holding multiple investment assets and real estate, each needed a statement of their tax obligations and a corresponding payment request. Done by hand, that work would have landed on the administration on top of everything else and stretched collection out over months.

Approach

I built a custom document-extraction pipeline, starting with a secure file-sharing environment where clients and staff upload documents. OCR and named-entity recognition on Microsoft Foundry pull the relevant details from powers of attorney and contracts, scanned identity documents, and the tax authority's PDF assessments and debt notes, including obligations from previous years; the pipeline then reconciles the amounts owed across sources and enters the results into the office's existing ERP automatically: 200+ complete records, including family dependents, that would otherwise have been typed in by hand. From there it generates a per-client tax statement and prepares the email that requests payment of both the tax obligation and the office's professional fees. **The customer support desk reviews every statement and email before anything goes out.**

Solution Overview

Three document streams converge on the office ERP before statements, payment requests and emails are composed and approved.

How It Works

`Information extraction` `OCR` `Custom ERP integration` `Secure file handling` `Email automation`

Tech Stack

`LangGraph` `Mistral OCR` `OpenAI` `Azure` `Frappe Cloud`

Results & Impact

The pipeline entered 200+ records into the office's ERP automatically and produced accurate tax statements, payment requests and collection emails for 30+ international investors. Six figures that had sat unbilled for years are now booked in accounts receivable, without the months of manual administration it would otherwise have taken.

ABOUT MANOS

Manos Fragkiadakis is an Applied AI Engineer building document intelligence and AI knowledge systems. He has over five years of Python software development experience and has built custom ERP and CRM systems for professionals. His recent work includes cited RAG across 3,000+ page legal case files and court-monitoring automation software used by 10+ law offices. He previously worked as an AI engineer and taught Natural Language Processing at Utrecht University.
